

# JUCT ELECTRIC DEFROST MEDIUM PROFILE UNIT COOLER

## SPECIFICATIONS INSTALLATION, OPERATION AND MAINTENANCE MANUAL

MEDIUM & LOW TEMP  
APPLICATIONS

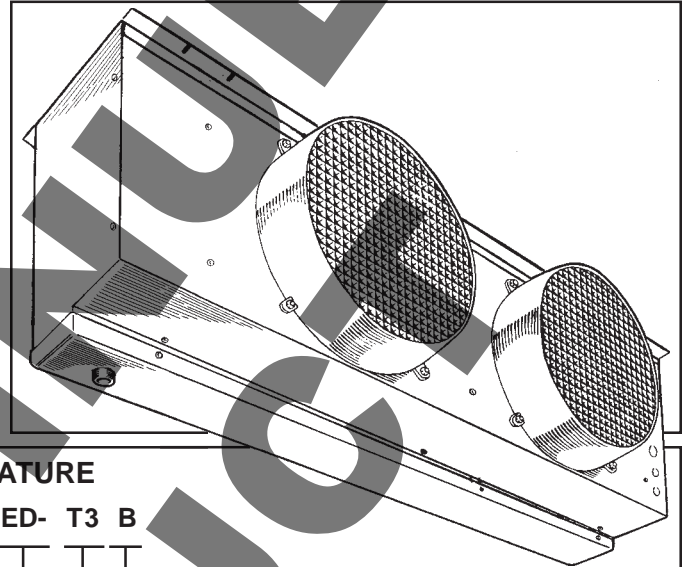

(-30°F ROOM TEMP. OR HIGHER)

ELECTRICAL POWER:

THREE PHASE

Bulletin: T30-JUCTE-PDI-14

1048679

### NOMENCLATURE

JUCT 1 24 -ED- T3 B

TRENTON MEDIUM PROFILE  
UNIT COOLER

NUMBER OF FANS

MBH CAPACITY AT 10 °F TD (60Hz)  
24 = 24,000 BTUH

DEFROST  
ED = ELECTRIC DEFROST

REVISION LEVEL

ELECTRICAL  
T3 = 208-230/3/60 T4 = 460/3/60  
T5 = 575/3/60 T7 = 200-220/3/50  
T8 = 380/3/60 T9 = 380-400/3/50

- \* Heavy gauge textured aluminum cabinet construction resists scratches/corrosion and minimizes weight for shipment, installation and service.
- \* Attractive and durable high density polyethylene fan guards with built-in throw boosters.
- \* 3/8 Tubing coil construction (reduces operating charge).
- \* VENTURI-FLO Distributor eliminates need for distributor nozzle selections.
- \* Adjustable Defrost Termination Thermostat with dual Fan Delay function.
- \* Stainless-Steel Defrost Heaters mounted on the coil for service accessibility
- \* Refrigerants R12, R22, R502, R134a, R404A, R407A, R407B, R407C, R507.

Where available use the HFESC series valve which includes sweat fittings with a removable/cleanable inlet screen.

Note: Above Selections are based on 100 °F Entering Liquid Temperature.

VENTURI - FLO distributor does not require the selection or use of distributor nozzles.

\* Valve part numbers are coded for R404A (also may be used on R502 or R507) and R134a (also may be used on R12)

Note: Above Selections are based on 100 °F Entering Liquid Temperature.  
VENTURI - FLO distributor does not require the selection or use of distributor nozzles.

# JUCT ELECTRIC DEFROST

## APPLICATION

These Unit Coolers are designed for use with R12, R22, R134a, R404A, R407A/B/C, R507 or R502 refrigerants.

At room temperatures above 34°F and evaporating temps no lower than 27°F the air flowing through the coil will accomplish the defrost. Temperatures of 34°F and below (to -40°F) require positive defrosting (either Electric or Hot Gas). These models require the use of (1) Time Clock (to initiate and terminate the defrost cycle). (2) Fan-Delay thermostat (to prevent evaporator fans from starting up right after defrost and blowing water on to fan blades, guards and floor) (3) Defrost Termination Control (to prevent unnecessary prolonged heating and steaming of the coil once all the ice and frost has melted).

The coil must not be exposed to any abnormal atmospheric or acidic environments. This may result in corrosion to the cabinet and possible coil failure (leaks). (Consult manufacturer for optional baked on phenolic protective coatings).

## INSTALLATION

The installation and start-up of Unit Coolers should only be performed by qualified refrigeration mechanics.

This equipment should be installed in accordance with all applicable codes, ordinances and local by-laws.

## INSPECTION

Inspect all equipment before unpacking for visible signs of damage or loss. Check shipping list against material received to ensure shipment is complete.

**IMPORTANT:** Remember, you, the consignee, must make any claim necessary against the transportation company. Shipping damage or missing parts, when discovered at the outset, will prevent later unnecessary and costly delays.

**If damage or loss during transport is evident, make claim to carrier, as this will be their responsibility, not the manufacturer's.**

Should carton be damaged, but damage to equipment is not obvious, a claim should be filed for "concealed damage" with the carrier.

**IMPORTANT:** The electrical characteristics of the unit should be checked at this time to make sure they correspond to those ordered and to electrical power available at the job site.

Save all shipping papers, tags and instruction sheets for reference by installer and owner.

## LOCATION

The unit location in the room should be selected to ensure uniform air distribution throughout the entire space to be refrigerated. Be sure that the unit does not draw air in, or blow directly out, through an opened door and that the product does not obstruct the free circulation of air. Allow a minimum of 24" clearance at each end and behind the unit.

The Unit Coolers draw air through the coil and discharge air from the fan side.

Consideration should be given to the coil location in order to minimize the piping run length to the condensing unit and floor drain.

## **MOUNTING**

Mounting brackets with 7/16" dia holes are provided for flush mounting to the ceiling. For details refer to dimensional data on page 6. Ensure adequate clearance (at least 24") is provided behind the coil as well as each side (to enable access to the electrical and refrigeration compartments).

**Ensure that the ceiling is level since the drain pan has been sloped for drainage during the defrost cycle.**

## **DRAIN LINE**

The drain line should be run from the drain connection, sloping at least 4" per foot. A trap outside the room will prevent warm air from entering through the tubing. Connection should be made to proper drainage facilities that comply with local regulations. To prevent freeze-up when the temperature of the refrigerated space is 32 °F or lower, the drain line should be heated along its run inside the cold room. The heated drain line should be insulated. It is recommended that the heater be energized at all times. A heat input of 20 watts per foot in a 0 °F room and 30 watts per foot in a -20 °F room is usually satisfactory.

The drain pan may be mounted with the drain fitting at either end (remove pan heater and relocate pan). See page 6 for drain fitting details.

**Ensure that the drain pan has sufficient slope for proper drainage (prevention of ice build up/blockage in pan).**

## **PIPING**

Refrigerant line sizes are important and may not be the same size as the coil connections. (depends on the length of run) If in doubt, consult "Recommended refrigerant line sizes" charts. (Engineering Manuals or other recognized sources of information).

## **WIRING**

Wire system in accordance with governing standards and local codes. See data and wiring diagrams on pages 2, 3, 4 and 5 for wiring arrangement. Electrical wiring is to be sized in accordance with minimum circuit ampacity rating.

For ease of identifying the proper wiring terminals, unit wiring is colour coded and terminal block connections are identified. When **fan delay thermostats** (combination fan delay and defrost termination) are installed, on start-up, the fans do not operate until the coil temperature is reduced to approximately 20 °F. It is normal for the fans to cycle a few times until the room temperature is brought down. At higher evaporating temperatures this control may not close and therefore should be by-passed or replaced with an adjustable type.

**The defrost termination control** is adjustable and

may be set at a minimum of 40 °F (fully CW) to a maximum of 75 °F (fully CCW). Normal settings is 55 °F. This can be increased if the defrost heaters are terminated too soon (frost still left) or decreased if terminated too long (steaming of coil). Time clock should be set for a fail-safe time termination of 30 minutes.

## **SYSTEM CHECK**

### **Before Start-Up:**

1. All wiring should be in accordance with local codes.
2. Refrigerant lines should be properly sized.
3. Electric defrost systems should include a liquid line solenoid valve.
4. Thorough evacuation and, dehydration has been performed.
5. The suction, discharge, and receiver service valves must be open.
6. The system should include a liquid line drier moisture indicator and suction filter.
7. Pour enough water into the drain pan to allow a good check on drainage and seal the trap.

### **After Start-Up:**

1. If necessary, temporarily by-pass fan delay control to run fans until room temp is lowered. (Run jumper wire from terminal N to F on control circuit terminal block).
2. Check the compressor oil level to ensure the correct oil charge.
3. Be sure that the expansion valve is properly set to provide the correct amount of superheat. (should be around 5 to 6 °F for 10 °F T.D. operation).
4. Heavy moisture loads are usually encountered when starting the system for the first time. If the coil temperature is below freezing, this will cause a rapid build-up of frost on the coil. During the initial pull-down frost build-up should be watched and the coil defrosted manually, as required.
5. Check for proper evaporator fan blade rotation.

## **MAINTENANCE**

The unit should be periodically inspected for any dirt or build-up on the fin surface and cleaned if necessary with a soft whisk or brush.

Also ensure coil and pan does not have any excessive ice build-up from improper defrost operation. When replacing heater elements first remove heater slot covers and heater clips. (See page 9 for detailed view).
