

# TDF DIRECT DRIVE DRY TYPE FLUID COOLERS

# SPECIFICATIONS INSTALLATION, OPERATION AND MAINTENANCE MANUAL

AIR COOLED MODELS FROM 200 MBH TO 2,000 MBH

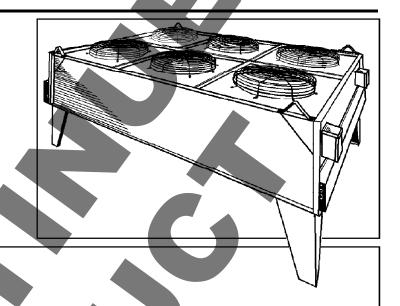

# ONE TO SIX FAN UNITS GLYCOL SELECTION DATA

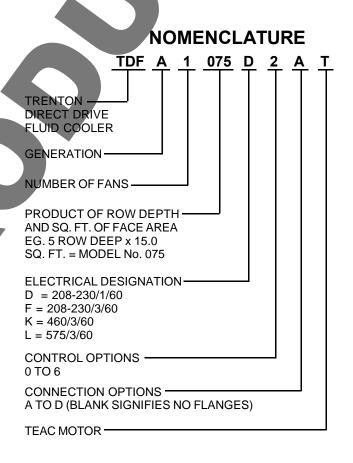

**BULLETIN: T60-TDF-PDI-10** 

1064631

- Heavy gauge galvanized steel casing with zinc plated nuts and bolts
- Die-formed legs
- High efficiency coils with rippled aluminum fins hydraulically bonded to copper tubing.
- Four-bladed heavy gauge rust resistant aluminum fans with steel spider and hub.
- Direct drive fan motors with inherent overload protection.
- Motors are weather protected by top end rain shields and shaft moisture slingers.

Data shown covers 10 models, 10 additional models available. Consult your local Trenton Refrigeration Sales Office.

### 1. Temperature Limitations

Trenton fluid coolers are suitable for leaving air temperatures up to a maximum of 130°F (54°C). Fluid temperature up to an average of 150°F (66°C) may be used at ambient temperatures up to 90°F (32°C). Entering fluid conditions should however not exceed 200°F (93°C).

### 2. Elevation Adjustment

Capacities are suitable for elevations up to 2000 ft. Above 2000 ft. and up to 3000 ft. elevation, unit capacities shown in Table 1 must be corrected by .90 before selecting unit.

### 3. Ratings

Ratings are based on a standard heat transfer rate and fluid velocity is varied to suit. Ratings and selections will be conservative. For additional fluid cooler models and more detailed analysis and selections, the Trenton fluid cooler computer

selection programme is available. Interpolation of capacities shown in Table 1 is permitted. Do not extrapolate.

### 4. Fluid Velocities

Fluid velocities are adjusted in accordance with the average temperature and the glycol mixtures used. Where a selected unit has a coil face area larger or smaller than the actual size required, the basic fluid velocity must be adjusted (see example).

### 5. Low Flow Rates

Where flow rate is low (approx. 1 0 USGPM or lower), standard circuiting may not provide the necessary tube velocity. Contact your Trenton Representative for special circuiting.

6. Trenton selection sheets are available for assisting in the selection and recording of data. Contact your Trenton Representative for copies.

### **SAMPLE SELECTION**

### **Example**

### Required:

A computer room application requires a TDF fluid cooler to handle a load of 50 USGPM of 50% Ethylene Glycol. (By wt.) from 115°F (46°C) to 105°F (40°C) at 95°F (35°C) Ambient. Unit located at sea level.

### Selection Method

### (1) Find the Total BTU/hr. Requirements (Q)

BTU/hr. = USGPM x fluid T.D. x Factor "N" (Table 2) = 50 x 10 x 434 = 217,000 BTU/hr. (63 kw)

### (2) Find minimum CFM required

CFM = 
$$\frac{\text{(Q) BTU/hr}}{1.09 \text{ x (130°F - Amb. Temp. °F.)}}$$
  
=  $\frac{217,000}{1.09 \text{ x 35}}$  = 5688 CFM

### (3) Find initial temperature difference and approach

I.T.D.: = Ent, fluid temperature minus entering ambient air temperature

Approach: = Leaving fluid temperature minus entering ambient temperature

# (4) Find MBH Capacity per sq. foot of fluid cooler surface

For an ITD of 20°F (11°C) and an approach of 10°F (6°C) read from Table 1 a unit capacity of 6.1 MBH/sq. ft. of coil surface area. As this application is at sea level no correction is necessary.

# (5) Determine total area of coil surface required Coil surface, sq. ft.

Total BTU/hr. (Q) (Step 1)
MBH/sq. ft. (Step 4) x 1000

 $= \frac{217,000}{6100}$ 

= 35.6 sq. ft.

### (6) Select Unit

From Table 1A select a unit size having a coil face area equal to or larger than 35.6 sq. ft. A Model 3152 has a face area of 37.5 sq. ft. This selection would be suitable.

### (7) Check air quantity

A Model 3152 is rated at 21150 CFM. This exceeds the minimum of 5688 CFM (step 2) and is satisfactory. (See Table 1A for CFM capacities).

### (8) Determine minimum fluid velocity required

From Table 3 for a 50% glycol solution at an average temperature of 110°F (43°C), the required basic velocity is 3.1 ft./second.

(NOTE. When unit selected has a face area larger or smaller than that required in step (5), basic fluid velocity should be adjusted using velocity correction factor from Table 4.

For this example, the required coil face area is 35.6 sq. ft. (5 above), Actual coil face area is 37.5 sq. ft.

Ratio oversize = 
$$\frac{37.5}{35.6}$$
 = 1.05

From Table 4 the velocity correction factor is .95. This is applied to the basic velocity to obtain th required minimum velocity:

 $.95 \times 3.1 = 2.9 \text{ ft./sec.}$ 

### (9) Circulting requirements

Refer to Chart 1 at 50 G.P.M., Type.30 circuiting will provide a velocity of 2.83 ft./sec. This is close to the required minimum velocity of 2.9 ft./sec. and may be used. (See note 2 Chart 1 for minimum velocity range).

### (10) Determining Fluid Pressure Drop

Knowing the circuiting to be used, the fluid pressure drop can be determined as follows:

- (a) Find the Total Equivalent Length of tube circuit from Table 5. For a model TDF 3152, using type 30 circuiting, the T.E.L. is 51 feet.
- (b) From Table 6, note the pressure drop under 50% solution at 2.9 ft./sec. as 060 P.S. 1. per foot of equivalent length.
- (c) Total pressure drop, P.S.I. = Pressure drop per foot (b) multiplied by 51 feet T.E.L. (a) plus standard allowance of 2 P.S. I. for headers: .060 x 51 = 3.06 P. S. I. Headers = 2.00 P. S. I. 5.06 P. S. 1.

Apply temperature correction factor from Table 7 =  $.97 \times 5.06 = 4.90 P. S. I.$ 

### (11) Final Selection

1 - Trenton TDF fluid cooler model 3152 using type 30 circuiting, having a fluid pressure drop of 4.90 P.S.I. connections will be same end (Table 5).

Headers and connection sizes will be 2 1/8" O.D. (Table 8).

.90	1.20
.95	1.10
1.00	1.00
1.10	.90
1.20	.80
1.30 and	.70
over	.70

\* When VEL correction factor is applied to basic fluid velocity maximum velocity should not exceed 6 ft./sec. Minimum should not exceed 2 ft./sec.

NOTES: 1. For more accurate readings use the following formula Fluid VEL Ft./sec. =  $\frac{\text{GPM} \times 1.70}{\text{Circuit Type}}$ 

 When selecting circuiting, the velocity obtained can be lower than the desired velocity by not more than 5%. A greater difference will require an alternate circuit type to be selected. Velocities higher than the desired velocity are acceptable.

# Where to Use Direct Drive Fluid Coolers COMPUTER COOLING SECONDARY HEAT EXCHANGERS

The Trenton direct drive cooler is suitable for use with computer room process cooling units. (See Fig. 1).

Particularly suitable for applications where long runs of refrigerant piping to an air cooled condenser are not practical. Eliminates the maintenance required with cooling towers and problems of winter operation. Piping can be easily installed and low ambient control can be obtained by using water regulating valves. Can be easily connected to city water for emergency use.

### REMOTE RADIATORS FOR DIESEL AND GAS ENGINES

A remote radiator is usually required with the larger style of diesel or gas engine. The Trenton T.D.F. direct drive cooler is suitable for this type of application. Designed to give the customer trouble free operation, the multiple fan arrangement reduces the possibility of down time. Units are completely pre-assembled and require only piping and electrical connections. Flexible circuiting permits low fluid pressure drop characteristics. (See Figure 2.)

### **INDUSTRIAL WATER COOLING\***

The problem of water conservation and pollution has become critical in recent years. The "Once-only" use of water for industrial cooling purposes has been wasteful and often unnecessary. By using a Trenton dry type cooler, water for industrial cooling applications can be cooled to within 10°F (6°C) of the ambient dry bulb temperature. The water is continuously recirculated and remains in a closed system so reducing the corrosion problem normally encountered in non recirculated systems. (See Fig. 3)

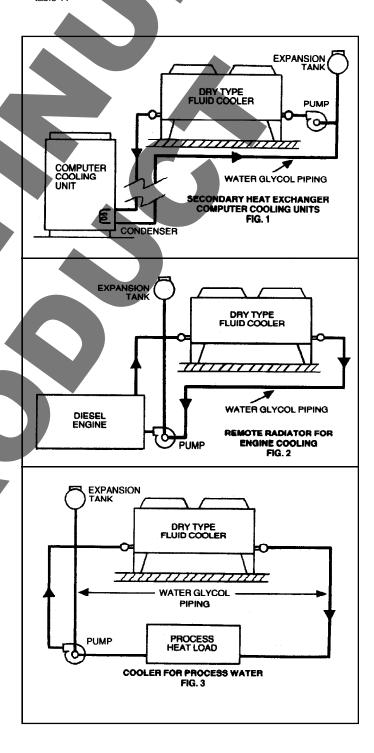

Considerable savings can be affected by using a Trenton dry type cooler. Many industries have reduced water consumption by millions of gallons and reduced maintenance costs to a fraction of that experienced prior to using a closed recirculation system.

# PRESSURE DROP TEMPERATURE CORRECTION FACTORS

### INSTALLATION INSTRUCTIONS

### **INSPECTION**

A thorough inspection of the cooler and all component parts should be made immediately on delivery and any camage in transit or any missing parts must be reported at once to the carrier, As consignee, you must make any claim for damage or losses. Damaged or missing parts discovered at the outset can prevent later costly delays and unnecessary expense. Electrical characteristics of all motors should also be checked to ensure that they are as ordered.

### WARNING

ADEQUATE PRECAUTIONS MUST BE TAKEN, AFTER FIELD LEAK TESTING, TO INSURE REMOVAL OF WATER IN TUBES. KEEPRITE RECOMMEND THAT A GLYCOL SOLUTION BE USED TO FLUSH THE COMPLETE COIL. FAILURE TO TAKE PRECAUTIONS CAN RESULT IN FROZEN TUBES SHOULD UNIT BE SUBJECTED TO LOW AMBIENT CONDITIONS BEFORE BEING PLACED IN OPERATION.

### HANDLING AND PLACING

Air Cooled Fluid Coolers are by necessity large and heavy pieces of mechanical equipment and must be handled as such. A fully qualified and properly equipped crew with necessary tackle and rigging should be engaged to locate the unit in position.

Lifting brackets have been provided at the corners for attaching lifting slings. Spreader bars or a similar device must be used when lifting so that the lifting force will be applied vertically on the lifting brackets. (See Fig. 1).

### LOCATION

In selecting a location for the cooler, consideration should be given to the following:

- Loading capacity of the floor or roof. Distance to suitable electrical supply.
- Adequate air circulation. (c)
- Accessibility for maintenance. (d)
- Local building codes. (e)
- Adjacent buildings relative to noise levels.
- Wishes of the purchaser. (g)

When all of the above points have been considered and a specific location chosen, it is advisable to obtain written approval of this location from the building and/or cooling unit owner. This may be the means of avoiding disagreement and expense at a later date.

### GENERAL CHECK-UP BEFORE STARTING

- Check the electrical characteristics of all components to be sure they agree with the power
- (2) Check fans for correct rotation on 3 phase units. Air is drawn through the cooler core. To change direction of rotation reverse any two (2) connecting leads.

### Important:

Units with solid state speed control option are for use with 208-230/1/60 service only.

### SERVICE INSTRUCTION

### Casing

Since the Fluid Cooler is normally installed outdoors, in the elements, the casing is fabricated from heavy gauge continuous process galvanized sheet steel for maximum rust and corrosion protection.

Motors are split capacitor type and are permanently lubricated.

### Coil

The coil should be checked periodically for cleanliness and for leaks. It is important that the coil be kept clean and free from any type of air blockage. The coil may be washed down with a hose when dirty. Power must be disconnected for this operation.

### **HEADER SIZING**

Table 8

G.P.M.	Header Size O.D.	Connections Available
0 - 10 11 - 20 21 - 30 31 - 50 51 - 80	1 1/8 (29mm) 1 3/8 (35mm) 1 5/8 (41mm) 2 1/8 (54mm)	PLAIN or MPT
81 - 80 81 - 150 151 - 250 251 - 400 400 - 700	2 5/8 (67mm) 3 1/8 (79mm) 4 1/8 (105mm) 5 1/8 (130mm) 6 1/8 (156mm)	PLAIN or FLANGED

### PIPING INSTALLATION

- All piping must comply with local codes. Care should be taken to correctly size the piping to ensure minimum pumping costs.
- Sufficient valves and unions should be provided to permit easy removal of equipment for repair or replacement.
- 3. All piping should be leak tested after installation.
- 4. Where city water is required for make-up, local plumbing codes should be observed. A pressure reducing valve should not be used in glycol systems. Installation of same would dilute the mixture in the case of a leak.
- Piping system must be complete with an expansion tank, purge valve, relief valve and fill point for glycol. Vent valves should be provided at system high points for air removal. See fig. 2 for typical glycol system piping.

### **CIRCULATING PUMP**

Mechanical seal type circulating pumps are generally used for glycol systems. Pump must be selected for friction loss through the cooler, piping and heat source. In a closed system no allowance is required for vertical lift.

Parallel pumps are recommended for standby operation where pump failure may interfere with a critical process. One pump on a parallel system may also carry the load under certain conditions thus contributing to power economy.

### **GLYCOL DESIGN**

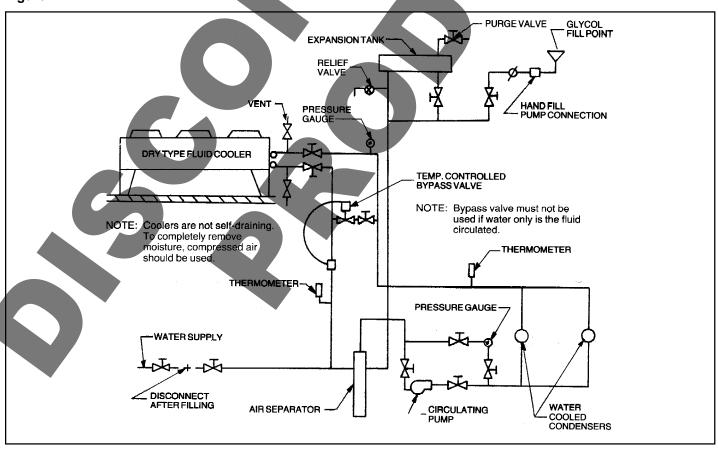

Usually a glycol solution is used in fluid cooler applications. The common range of mixtures will be 30% to 50% in water. Glycol mixtures have a higher density than water, but a lower specific heat. This will result in an increased flow rate over water by approx. 15% - 20%. Where a fluid cooler is used with an existing water cooled condenser, a decrease in condenser capacity will result. Condenser manufacturers should be consulted to obtain recommended flow rates.

### MAINTAINING THE SYSTEM

As the system is the closed type with a compression tank, little or no corrosion will take place as the initial oxygen is absorbed. No fresh oxygen is introduced unless the system requires re-filling due to leaks or repairs. Maintenance of the system will therefore be confined to the pumps and valves. Manufacturers data should be consulted for the maintenance of these items.

### TYPICAL FLUID COOLER PIPING SYSTEM

Figure 2

### **DESIGN SPECIFICATIONS**

### **CASING**

Heavy gauge galvanized steel with zinc plated nuts and bolts. All Trenton Fluid Coolers are mounted on heavy die-formed legs.

### **COILS**

The Trenton Direct Drive Fluid Cooler is equipped with high-efficiency heat transfer surface. Surface consists of rippled aluminum fins hydraulically bonded to copper tubing. Coils are leak tested to 300 p.s.i. under water. Flanged connections available if required.

### **FANS**

Four-bladed, constructed from heavy gauge, rustresistant aluminum with steel spider and hub. Zinc plated for added weather protection.

### **MOTORS**

Direct drive fan motors with permanently lubricated ball bearings. Motors are complete with inherent overload protection. Motors are weather protected by top end rain shields and shaft moisture slingers. Contactors available if required. Motors are all wired to an electrical box on end of unit.
